CSC 2400 – Spring 2026 Algorithms Project

Student GitHub Repository Policy (Detailed Summary)

This document summarizes the REQUIRED GitHub standards for your term project. This is a core grading component. Failure to follow these standards will result in point deductions.

1. Repository Name (Required)

Your repository name must clearly reflect:

- The problem

- The algorithm comparison

- (Encouraged) the dataset

✅ Good Examples:

• VRP_Greedy_vs_ACO_SolomonR101

• SetCover_LP_vs_MFO_ORLibrary

• ExamScheduling_GA_vs_HHO_ITC2007

• BinPacking_FFD_vs_BB_SyntheticScaling

❌ NOT Acceptable:

• final_project

• algorithms_project

• team3_project

• project1

• CSC_2440_project

If the name does not reflect the content of your project, points will be deducted.

2. Required Folder Structure

Your repository MUST include:

/code

/results

/graphs (or /figures or /images)

/report

/slides

/references

Optional (if applicable):

/data

/notebooks

/demo

/video

❌ NOT Acceptable:

• All files dumped in root directory

• Random file names like 'test1.py', 'newcode.py', 'finalfinal.py'

• Missing report or slides folders

• Screenshots instead of actual results files

3. Code Quality Expectations

Your code must be:

• Modular

• Organized

• Runnable without manual editing

• Free of unused files

❌ NOT Acceptable:

• Hard-coded file paths

• Broken imports

• Large commented-out blocks of old code

• Code that only runs on one team member's machine

4. README (Mandatory)

Your README must include:

• Project title

• Team members

• Problem description

• Algorithms implemented

• Dataset(s) used

• How to run the project

• GenAI usage disclosure

❌ NOT Acceptable:

• Empty README

• 'See report for details' only

• No run instructions

• No disclosure of GenAI use

5. Scientific Report (Required)

Your report must resemble a short research paper and include:

• Abstract

• Problem definition

• Algorithm explanations

• Theoretical complexity

• Experimental design

• Results & analysis

• References

❌ NOT Acceptable:

• Only screenshots of output

• No analysis or interpretation

• Results that do not match repository data

6. Authorship & Collaboration (Required)

• All team members must be listed as collaborators.

• All members must be co-authors in the report.

• Repository must not belong to only one student.

❌ NOT Acceptable:

• One owner, others not listed

• Report lists names but repository does not

• No evidence of shared contribution

7. Reproducibility Requirement

A TA must be able to:

• Clone the repository

• Install dependencies

• Run experiments

• Reproduce graphs

If your project cannot be reproduced, points will be deducted.

8. Professional Expectation

This repository should be something you could show to an employer or include in a graduate application. Treat it as a professional portfolio artifact.
